

Subaru Program - Brand Compliant. AutoStone specification sheet 2018 ver 01

AutoStone Floor Systems for your showroom customer areas and bathrooms. The images below show AutoStone brand compliant Subaru showroom tile. Call the Subaru hotline for information and a quote at: 800-625-5314 or email your Subaru team at: subaru@autostoneusa.com

CT-1 (floor) | CWT-1 (walls)

Series: Premier.4
Color: Charcaol
Finish: Natural | Matte

24" x 24" (nominal)
Actual: 600 mm x 600 mm

9.5 mm thickness. Rectified tile with beveled edge surface

Packaging:
Tiles per carton: (4)
SF per carton: 15.5 (sf)
Cartons per pallet: (28)

CWT-2 (walls - alternate)

Series: Premier.4
Color: Charcaol
Finish: Polished

24" x 24" (nominal)
Actual: 600 mm x 600 mm

9.5 mm thickness. Rectified tile with beveled edge surface

Packaging:
Tiles per carton: (4)
SF per carton: 15.5 (sf)

CT-1 (floor)
CWT-1 or 2 (walls)
Series: Premier.4
Color: Charcaol
Finish: Polished | Natural

03" x 12" nominal
Actual: 75 mm x 300 mm (bullnose base)

9.5 mm thickness.
Packaging:
Pieces per carton: (20)
LF per carton: 20 (lf)
Cartons per pallet: (60)

Manage STF (slip, trip and fall) risk better

The reality of an automotive service facility is that dealers conduct business on floors that have contaminants tracked in by vehicles throughout the day. This increases STF (slip, trip, fall) risk exposure. Employees and customers are constantly exposed to these STF conditions which if not properly managed can lead to workplace injuries, litigation, and higher general liability insurance premiums.

The question for a dealership is, ***“what is the best floor surface to address the reality of STF risk we face in the service drive and workshop space?”***

We suggest that the ***drive***series! is a better solution to address and reduce STF risk. With employees and customers walking on floors with contaminants throughout the work day automotive dealers face greater STF risk due to the nature of business operations.

The ***drive***series! surface is a repeating pattern of three lines elevated above the bed of the tile. These lines enable shoe (sole) traction to occur above the tile bed, where moisture or surface contaminants rest until removed by daily dealership cleaning practices.

Ultra-cleanable technology

The **drive**series! comes with AutoStone's proprietary brightfinish technology. Our brightfinish technology is a permanent sealant baked-in during the kiln-firing (manufacturing) process. The brightfinish retards rubber transfer and resists surface staining better than comparative clinker or tile products, especially those with a sandpaper textured surface finish.

Brightfinish permanently seals surface micro-pores which collect and hold on to rubber transfer and other contaminants which cause clinker or tile products with sandpaper textured surfaces to darken over time. With brightfinish, your service department floors are easier to clean and can always be restored to like-new condition if ever dealership cleaning practices temporarily diminish.

Service department areas and drive lanes look cleaner, brighter and present a better appearance. Dealership cleaning practices are made easier with floor systems with our brightfinish. Ultra-cleanable technology for a cleaner, brighter floor!

Another tile product showing darkening due to rubber transfer contaminants.

Better design, better results, safer workshops!

The **drive**series! elevated traction surface is a smarter design that provides a better surface to manage risk in your service drive and service department areas. The **drive**series! comes with brightfinish, which cleans better, retards staining and delivers better workshop and drive results.

bright**finish** - ultra cleanable technology.

www.bestshopfloor.com

brightfinish - ultra cleanable technology

The brightfinish is unique to AutoStone. It is a permanent surface sealant baked-in during the kiln-firing process. It is applied to our **enviroshop** and **driveseries!** tile products. The brightfinish permanent sealant aides dealerships with their cleaning practices by sealing all surface micropores which trap and hold-on to rubber transfer, grease, oil or other contaminants.

“Your shop is an extension of your showroom” with an AutoStone Floor System.

Why sand-paper textured products fail

The pictures (shown right) are attic-stock tile “out of the box” and placed on the installed floor. This was a new-build automotive service drive and workshop facility that opened around October, 2015. These pictures were taken in August 2016, ten months after the dealership started operations.

After being cleaned multiple nights per week, including using a floor scrubber machine, efforts to keep the tile from darkening failed.

The sand-paper finish surface shows darkening due to contaminants which include: rubber-transfer, oil, grease and other elements present even after cleaning.

STF (slip, trip and fall) risk.

When contaminants remain on the surface, STF (slip, trip and fall) risk increases. When moisture is re-introduced to the floor, this re-activates the rubber, grease, oil and other contaminants. The result is a floor with increased STF risk.

Get better results.

Dealers get better cleaning results from AutoStone floors with a brightfinish surface. Brightfinish surfaces aide your cleaning practices and will help your dealership floors look cleaner and brighter.

Expect more, get more, get AutoStone for your service and workshop environments.
